

Technology Forecast 2020 in Taiwan

Prof. Hsueh-Liang WU
National Taiwan University

Dr. Julie C. L. SUN
Taiwan Institute of Economic Research

24 August, 2011

Why is tech foresight needed in Taiwan?

- Technology has long been considered one of the building blocks of international competitiveness of a nation.
- As technologies progress fast and get diversified, it is difficult for a government or corporations to decide the priority of technological development.
- Technology foresight has been thus used as an important decision-making activity of a country's science & technology policy.
- Technology foresight refers to a scientific process involving the use of focused discussion among experts in order to converge divergent opinions or expertise into a consensus to make the forecast result more socially consented upon.

2

The challenges of foresight activities

Although tech. foresight can help reach consensus from experts across fields and avoid dispersed R&D efforts, there are several shortcomings.

- only scientists participate (making the foresight merely a PR activity after few elites' efforts to justify their use of S&T budgets),
- the implementation process is long, tedious and exhausting",
- forecast activity consumes too many resources/ mobilization costs are excessive,
- forecast results do not take economic and social development needs into consideration,
- forecast activity cannot be linked directly with the priority of R&D budget allocation,
- forecast activity lacks focus on assessing impact or influence on individual sectors".

3

The goal of this study

- In response to the recent calls for more efforts on making the foresight activity not only a 'scientifically-certified' process but also a 'socially-robust' & 'politically-relevant' approach,
- This study aims to explore the most demanded & feasible technologies for Taiwan by 2020.

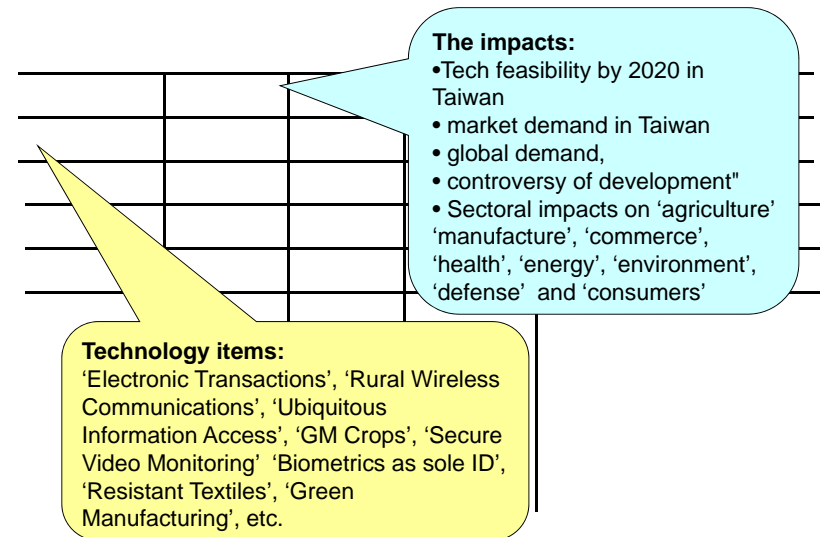

4

The process of research

- We began with the 56 technology items identified & defined by RAND in 2006.
 - Those items are from interdepartmental and technology-based fields such as biotechnology, ICT, nanotechnology, material science, energy, etc.
- then we designed a survey questionnaire on the parsimonious basis, and
- 20 experts were invited to fill in the questionnaire.
 - technology experts accounted for approximately 40%, economists for approximately 30%, and management experts for approximately 30%.

5

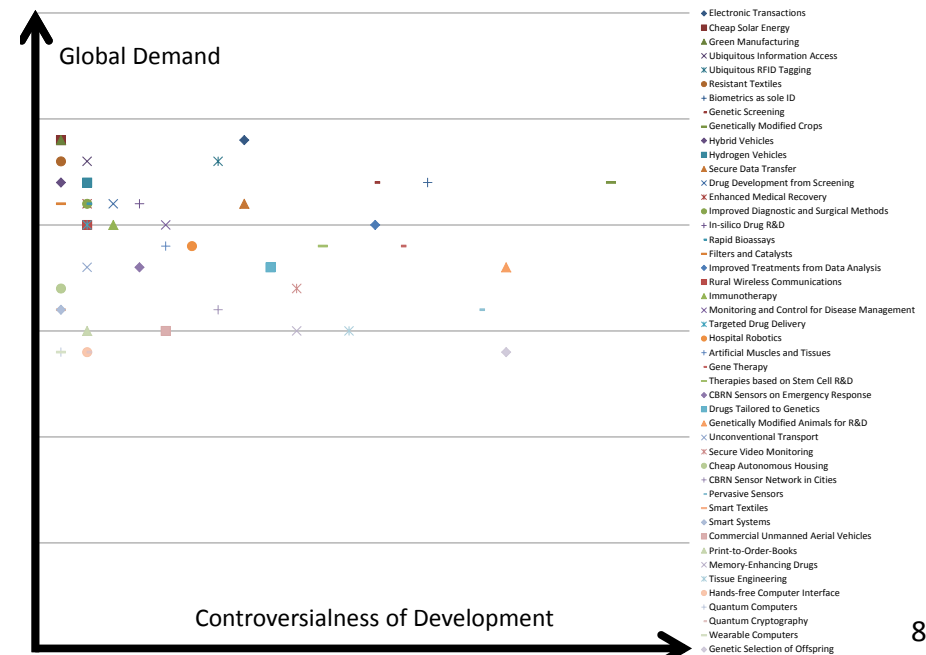

What is our questionnaire?

14

Conclusions

- Despite the self-report bias, this study is an early attempt in Taiwan to identify the important technologies feasible technologically and demanded socio-economically by 2020
- Recommendation for the foresight activities in the future:
 - Including more stakeholders in the ST policy making & implementation.
 - Identifying more indigenous demanded technologies rather than following those defined by technologically leading countries.
